Investment Strategy

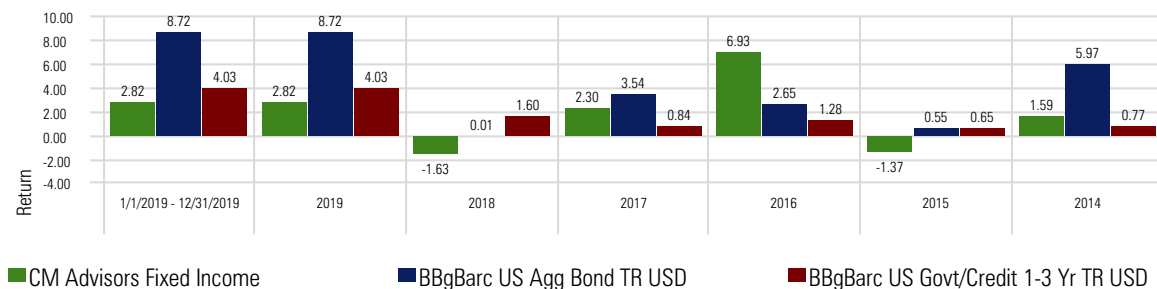

The investment seeks to preserve capital and maximize total return. The fund invests primarily in U.S. dollar denominated fixed income securities that the Advisor believes are undervalued. It may invest in all types of fixed income securities but will typically invest in fixed income securities such as corporate bonds, U.S. government securities and mortgage-backed securities. At least 80% of its net assets (including the amount of any borrowings for investment purposes) will be invested in fixed income investments, which include fixed income securities and shares of other RICs that invest primarily in fixed income securities.

CM Advisors Fixed Income Fund composition is subject to change.

Performance data quoted represents past performance. Past performance does not guarantee future results. All performance assumes reinvestment of dividends, interest, and capital gains. The investment return and principal value of an investment will fluctuate so that investor's shares, when redeemed, may be worth more or less than their original cost. Current performance may be lower or higher than the performance data quoted. For performance information current to the most recent month end, call 1-888-859-5856.

The Bloomberg Barclays U.S. Aggregate Bond Index is weighted according to market capitalization. Treasury securities, mortgage-backed securities (MBS) foreign bonds, government agency bonds and corporate bonds are some of the categories included in the index. The bonds represented are medium term with an average maturity of about 4.57 years. Bloomberg Barclays US Aggregate 1-3 Years Total Return Index consists of publicly issued investment grade corporate, US Treasury and government agency securities with remaining maturities of one to three years. You cannot invest directly in an index.

Investment in the Fund is subject to investment risks, including, without limitation, market risk, interest rate risk, management style risk, business and sector risk, small cap risk, credit risk, maturity risk, risks related to other equity securities and other investment companies risk. For more information about the Fund, including the Fund's objectives, charges, expenses and risks (including more information about the risks listed above), please read the prospectus.

The **Average Maturity** is computed by weighting the maturity of each security in the portfolio by the market value of the security, then averaging these weighted figures. The **Average Coupon** is the interest rate stated on a bond when it is issued. The **Average Duration** is a time measure of a bond's interest-rate sensitivity, based on the weighted average of the time periods over which a bond's cash flows accrue to the bondholder. Time periods are weighted by multiplying by the present value of its cash flow divided by the bond's price. (A bond's cash flows consist of coupon payments and repayment of capital.) A bond's duration will almost always be shorter than its maturity, with the exception of zero-coupon bonds, for which maturity and duration are equal. The **Morningstar Credit Rating** is sourced from Standard & Poors ("S&P") Global Rating. **Alpha** is the excess return of the fund relative to the return of the benchmark index. **Beta** is a measure of the volatility, or systematic risk, of a security or a portfolio in comparison to the market as a whole. **R2 (R-Squared)** is a statistical measure that represents the percentage of a fund's movement that can be explained by movements in the benchmark index. **Tracking Error** is a divergence between the price behavior of a position or a portfolio and the price behavior of a benchmark. **Information Ratio** is a ratio of portfolio returns above the returns of a benchmark to the volatility of those returns. **Excess Return** is the investment returns from a security or portfolio that exceed a benchmark with a similar level of risk. **Standard Deviation** is a measure of the dispersion of a set of data from its mean. **Sharpe Ratio** is the average return in excess of the risk-free rate per unit of volatility or total risk. **Sortino Ratio** is a variation of the Sharpe ratio that differentiates harmful volatility from total volatility by using the asset's standard deviation of negative asset returns, called downside deviation.

CM Advisors Fixed Income Fund is part of the CM Advisors Family of Funds.
